Related to the work [*Relaxation of an optimal design problem for the heat equation*, J. Math. Pures Appl. (2008) AM-Pedregal-Periago] where the following optimal design problem is analyzed :

$$(\mathsf{P}_{T}) \quad \text{Minimize in } \boldsymbol{\mathcal{X}} \in \mathbf{CD}: \quad J_{T}\left(\boldsymbol{\mathcal{X}}\right) = \frac{1}{T} \int_{0}^{T} \int_{\Omega} K\left(x\right) \nabla u\left(t, x\right) \cdot \nabla u\left(t, x\right) dx dt$$

 $\Omega \subset \mathbb{R}^{N}$, where the state variable u = u(t, x) is the solution of the system

$$\begin{cases} \beta(x) u'(t, x) - \operatorname{div} \left(K(x) \nabla u(t, x)\right) = f(t, x) & \text{in} \quad (0, T) \times \Omega\\ u = 0 & \text{on} \quad (0, T) \times \partial \Omega\\ u(0, x) = u_0(x) & \text{in} \quad \Omega, \end{cases}$$
(1)

with

$$\begin{cases} \beta(x) = \boldsymbol{\mathcal{X}}(x) \beta_1 + (1 - \boldsymbol{\mathcal{X}}(x)) \beta_2 \\ K(x) = \boldsymbol{\mathcal{X}}(x) k_1 I_N + (1 - \boldsymbol{\mathcal{X}}(x)) k_2 I_N. \end{cases}$$

 $k_i > 0$ - thermal conductivity , $\beta_i = \rho_i c_i \ (\rho_i > 0$ mass density - $c_i > 0$ specific heat)

The design variable \mathcal{X} indicates the region occupied by the material (β_1 , k_1) and is subjected to belong to the class of *classical designs* **CD** defined as

$$\mathbf{CD} = \left\{ \boldsymbol{\mathcal{X}} \in L^{\infty} \left(\Omega; \{0, 1\} \right) : \int_{\Omega} \boldsymbol{\mathcal{X}}(x) dx = L|\Omega| \right\},$$

The relaxed formulation (RP_T) (T fixed) - Overview

The relaxed formulation (RP_T) involves the space of relaxed designs

$$\mathbf{RD} = \left\{ (\theta, K^{\star}) \in L^{\infty} \left(\Omega; [0, 1] \times \mathcal{M}_{N}^{s} \left(k_{1}, k_{2} \right) \right) : K^{\star} \left(x \right) \in G_{\theta(x)} \text{ a.e. } x \in \Omega, \left\| \theta \right\|_{L^{1}(\Omega)} = L|\Omega| \right\},$$

where $\mathcal{M}_{N}^{s}(k_{1}, k_{2})$ is the space of real symmetric squared matrices M of order N satisfying, for all $\xi \in \mathbb{R}^{N}$, $k_{1} |\xi|^{2} \leq M\xi \cdot \xi$ and $k_{2} |\xi|^{2} \leq M^{-1}\xi \cdot \xi$.

For a given $\theta \in L^{\infty}(\Omega; [0, 1])$, the so-called G_{θ} -closure is the set of all symmetric matrices with eigenvalues $\lambda_1, \dots, \lambda_N$ satisfying

$$\begin{cases} \lambda_{\theta}^{-} \leq \lambda_{j} \leq \lambda_{\theta}^{+}, & 1 \leq j \leq N, \\ \sum_{j=1}^{N} \frac{1}{\lambda_{j} - k_{1}} \leq \frac{1}{\lambda_{\theta}^{-} - k_{1}} + \frac{N - 1}{\lambda_{\theta}^{+} - k_{1}}, \\ \sum_{j=1}^{N} \frac{1}{k_{2} - \lambda_{j}} \leq \frac{1}{k_{2} - \lambda_{\theta}^{-}} + \frac{N - 1}{k_{2} - \lambda_{\theta}^{+}}, \end{cases}$$

where $\lambda_{\theta}^{-} = \left(\frac{\theta}{k_1} + \frac{1-\theta}{k_2}\right)^{-1}$ is the harmonic mean and $\lambda_{\theta}^{+} = \theta k_1 + (1-\theta) k_2$ the arithmetic mean of (k_1, k_2) .

$$(3)$$

with $\beta^{*}(x) = \theta(x)\beta_{1} + (1 - \theta(x))\beta_{2}$ is a relaxation of (P_{T}) in the following sense:

(i) there exists at least one minimizer for (RP_T) in the space RD,

(ii) up to a subsequence, every minimizing sequence of classical designs \mathcal{X}_n converges, weak-* in $L^{\infty}(\Omega; [0, 1])$, to a relaxed density θ , and its associated sequence of tensors

$$K_n = \mathcal{X}_n k_1 I_N + (1 - \mathcal{X}_n) k_2 I_N$$

H-converges to an effective tensor K^* such that (θ, K^*) is a minimizer for (RP_T) , and

(iii) conversely, every relaxed minimizer $(\theta, K^*) \in \mathbf{RD}$ of (RP_T) is attained by a minimizing sequence \mathcal{X}_n of (P_T) in the sense that

$$\begin{array}{ll} \mathcal{X}_n \xrightarrow{\sim} \theta & \text{weak } \star \text{ in } L^{\infty} \left(\Omega \right), \\ \mathcal{K}_n \xrightarrow{H} \mathcal{K}^{\star}. \end{array}$$

The limit (P_{∞}) of (P_T) as $T \to \infty$ and its relaxation (RP_{∞}) - Overview

Assuming that the heat source *f* depends only on the space variable, the unique solution of (1) converges as $t \to \infty$ to $\overline{u} \in H_0^1(\Omega)$, solution of the stationary equation

$$\begin{cases} -\operatorname{div} \left(K\left(x\right)\nabla\overline{u}\left(x\right)\right) = f\left(x\right) & \text{in} \quad \Omega\\ u = 0 & \text{on} \quad \partial\Omega. \end{cases}$$
(4)

Associated with this PDE we consider the design problem

$$(\mathsf{P}_{\infty}) \quad \text{Minimize in } \mathcal{X} \in \mathbf{CD}: \quad J_{\infty}(\mathcal{X}) = \int_{\Omega} K(x) \nabla \overline{u}(x) \cdot \nabla \overline{u}(x) dx.$$

(ELLIPTIC CASE)

Consider the following problem

$$(\mathsf{RP}_{\infty})$$
 Minimize in $(heta, K^*) \in \mathsf{RD}$: $J^*_{\infty}(heta, K^*) = \int_{\Omega} K^*(x) \nabla \overline{u}(x) \cdot \nabla \overline{u}(x) dx$

where $\overline{u} \in H_0^1(\Omega)$ solves

$$\begin{cases} -\operatorname{div} (K^* \nabla \overline{u}) = f & \text{in} \quad \Omega\\ \overline{u} = 0 & \text{on} \quad \partial \Omega. \end{cases}$$

 (RP_{∞}) is a relaxation of (P_{∞}) is the sense of the previous theorem. Moreover, the optimal effective tensor for (RP_{∞}) is obtained in the form of a first-order laminate in any direction orthogonal to $\nabla \overline{u}$.

The limit (P_{∞}) of (P_T) as $T \to \infty$ and its relaxation (RP_{∞}) - Overview

Assuming that the heat source *f* depends only on the space variable, the unique solution of (1) converges as $t \to \infty$ to $\overline{u} \in H_0^1(\Omega)$, solution of the stationary equation

$$\begin{cases} -\operatorname{div} \left(K\left(x\right)\nabla\overline{u}\left(x\right)\right) = f\left(x\right) & \text{in} \quad \Omega\\ u = 0 & \text{on} \quad \partial\Omega. \end{cases}$$
(4)

Associated with this PDE we consider the design problem

$$(\mathsf{P}_{\infty}) \quad \text{Minimize in } \mathcal{X} \in \mathbf{CD}: \quad J_{\infty}(\mathcal{X}) = \int_{\Omega} K(x) \nabla \overline{u}(x) \cdot \nabla \overline{u}(x) dx.$$

Theorem (ELLIPTIC CASE)

Consider the following problem

$$({\it RP}_{\infty}) \quad {\it Minimize\ in\ } \left(\theta, {\it K}^{\star}\right) \in {\bf RD}: \quad {\it J}^{\star}_{\infty}\left(\theta, {\it K}^{\star}\right) = \int_{\Omega} {\it K}^{\star}(x) \nabla \overline{u}(x) \cdot \nabla \overline{u}(x) dx$$

where $\overline{u} \in H_0^1(\Omega)$ solves

$$\begin{cases} -\operatorname{div} \left(K^* \nabla \overline{u} \right) = f & \text{in} \quad \Omega\\ \overline{u} = 0 & \text{on} \quad \partial \Omega. \end{cases}$$

 (RP_{∞}) is a relaxation of (P_{∞}) is the sense of the previous theorem. Moreover, the optimal effective tensor for (RP_{∞}) is obtained in the form of a first-order laminate in any direction orthogonal to $\nabla \overline{u}$.

We assume henceforth that $f \in L^2(\Omega)$ is time independent and that $u_0 \in L^2(\Omega)$.

Let $\{T_n\}_{n\in\mathbb{N}}$ be an increasing sequence of positive times converging to infinity. For each T_n , problem (RP_{T_n}) has (at least) a minimizer $\left(\theta_{T_n}, K_{T_n}^{\star}\right) \in \mathbf{RD}$.

Since $(\theta_{T_n}, K_{T_n}^{\star})$ is bounded in $L^{\infty}(\Omega; [0, 1] \times \mathcal{M}_N^s(k_1, k_2))$, up to subsequences still labeled by *n*, we have

$$\begin{cases} \theta_{T_n} & \to & \theta_{T_{\infty}} \text{ weak-}^* \text{ in } L^{\infty} \left(\Omega; [0, 1]\right) \\ K_{T_n}^{\star} & \to & K_{T_{\infty}}^{\star} \end{cases} \quad \text{as} \quad n \to \infty$$

(Allaire-AM-Periago)

If $\left(\theta_{T_n}, K_{T_n}^*\right)$ is an optimal solution of (RP_{T_n}) , then any weak limit $\left(\theta_{T_{\infty}}, K_{T_{\infty}}^*\right)$ of a converging subsequence of $\left(\theta_{T_n}, K_{T_n}^*\right)$ is an optimal solution of (RP_{∞}) .

◆□▶ ◆□▶ ◆ □▶ ★ □▶ - □ - つへの

We assume henceforth that $f \in L^2(\Omega)$ is time independent and that $u_0 \in L^2(\Omega)$.

Theorem (Allaire-AM-Periago)

If $(\theta_{T_n}, K_{T_n}^*)$ is an optimal solution of (RP_{T_n}) , then any weak limit $(\theta_{T_{\infty}}, K_{T_{\infty}}^*)$ of a converging subsequence of $(\theta_{T_n}, K_{T_n}^*)$ is an optimal solution of (RP_{∞}) .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Lemma

Let un be the solution of

$$\begin{cases} \beta_n^{\star}(x) u_n'(t,x) - div \left(K_{T_n}^{\star}(x) \nabla u_n(t,x) \right) = f(x) & in \quad (0,\infty) \times \Omega \\ u_n = 0 & on \quad (0,\infty) \times \partial \Omega \\ u_n(0,x) = u_0(x) & in \quad \Omega, \end{cases}$$
(5)

with $\beta_n^{\star}(x) = \theta_{T_n}(x)\beta_1 + (1 - \theta_{T_n}(x))\beta_2$. Then,

$$\lim_{n \to \infty} \frac{1}{T_n} \int_0^{T_n} \int_\Omega K_{T_n}^{\star}(x) \nabla u_n(t, x) \cdot \nabla u_n(t, x) \, dx \, dt = \int_\Omega K_{T_\infty}^{\star}(x) \nabla \overline{u}_{\infty}(x) \cdot \nabla \overline{u}_{\infty}(x) \, dx,$$
(6)

where $\overline{u}_{\infty}(x) \in H_{0}^{1}(\Omega)$ is the solution of

$$\begin{cases} -\operatorname{div}\left(K_{T_{\infty}}^{\star}(x)\nabla\overline{u}_{\infty}(x)\right) = f(x) & \text{in} \quad \Omega\\ \overline{u}_{\infty} = 0 & \text{on} \quad \partial\Omega. \end{cases}$$

$$\begin{cases} \beta_n^{\star}(x) v_n'(t, x) - \operatorname{div} \left(K_{T_n}^{\star}(x) \nabla v_n(t, x) \right) = 0 & \text{in} \quad (0, \infty) \times \Omega \\ v_n = 0 & \text{on} \quad (0, \infty) \times \partial\Omega \\ v_n(0, x) = u_0(x) - \overline{u}_n(x) & \text{in} \quad \Omega \\ & \mathbf{v}_n \to \mathbf{v}_n \to$$

We decompose

$$\frac{1}{T_n}\int_0^{T_n}\!\!\!\!\int_{\Omega} K_{T_n}^{\star}(x)\nabla u_n(t,x)\cdot\nabla u_n(t,x)\,dxdt - \int_{\Omega} K_{T_{\infty}}^{\star}(x)\nabla \overline{u}_{\infty}(x)\cdot\nabla \overline{u}_{\infty}(x)\,dx = l_1^n + l_2^n$$

where

$$I_{1}^{n} = \frac{1}{T_{n}} \int_{0}^{T_{n}} \int_{\Omega} K_{T_{n}}^{\star} \nabla u_{n}(t, x) \cdot \nabla u_{n}(t, x) \, dx dt - \int_{\Omega} K_{T_{n}}^{\star} \nabla \overline{u}_{n}(x) \cdot \nabla \overline{u}_{n}(x) \, dx$$
$$I_{2}^{n} = \int_{\Omega} K_{T_{n}}^{\star} \nabla \overline{u}_{n}(x) \cdot \nabla \overline{u}_{n}(x) \, dx - \int_{\Omega} K_{T_{\infty}}^{\star}(x) \, \nabla \overline{u}_{\infty}(x) \cdot \nabla \overline{u}_{\infty}(x) \, dx.$$

where \overline{u}_n solves

$$\begin{cases} -\operatorname{div}\left(K_{T_{n}}^{\star}\nabla\overline{u}_{n}\right)=f & \text{in} \quad \Omega\\ \overline{u}_{n}=0 & \text{on} \quad \partial\Omega. \end{cases}$$
(8)

To show that $l_1^n \to 0$, we prove that there exist $C_1, C_2 > 0$, independent of *n*, such that

$$\|u_n(t) - \overline{u}_n\|_{L^2(\Omega)} \le C_1 e^{-C_2 t}, \quad t > 0,$$
 (9)

The function $v_n(t, x) = u_n(t, x) - \overline{u}_n(x)$ solves

$$\begin{cases} \beta_n^{\star}(x) v_n'(t,x) - \operatorname{div} \left(K_{T_n}^{\star}(x) \nabla v_n(t,x) \right) = 0 & \text{in} \quad (0,\infty) \times \Omega \\ v_n = 0 & \text{on} \quad (0,\infty) \times \partial \Omega \\ v_n(0,x) = u_0(x) - \overline{u}_n(x) & \text{in} \quad \Omega. \end{cases}$$

Convergence of $I_1^n \to 0$ as $T_n \to \infty$

Using the Fourier method,

$$\begin{aligned} v_n(t,x) &= \sum_{k=1}^{\infty} a_n^k e^{-\lambda_n^k t} \omega_n^k(x), \quad \omega_n^k \in H_0^1(\Omega), \quad \left\| \omega_n^k \right\|_{L^2_{\beta_n^\star}(\Omega)}^2 = \int_{\Omega} \beta_n^\star \left| \omega_n^k \right|^2 dx = 1 \\ & \begin{cases} -\operatorname{div} \left(K_{T_n}^\star \nabla \omega_n^k \right) = \lambda_n^k \beta_n^\star \omega_n^k & \text{in } \Omega \\ \omega_n^k = 0 & \text{on } \partial\Omega, \end{cases} \end{aligned}$$

with 0 $<\lambda_n^1<\lambda_n^2\leq\lambda_n^3\leq\cdots$, its associated eigenvalues, and

$$a_{n}^{k}=\int_{\Omega}\beta_{n}^{\star}\left(x\right)\left(u_{0}\left(x\right)-\overline{u}_{n}\left(x\right)\right)\omega_{n}^{k}\left(x\right)dx,\quad k,n\in\mathbb{N}.$$

Using that $\beta_1 \leq \beta_n^*(x)$ a.e. $x \in \Omega$ and Parseval's identity, we have

$$\beta_1 \| v_n(t) \|_{L^2(\Omega)}^2 \le \| v_n(t) \|_{L^2_{\beta_n^{\star}}(\Omega)}^2 = \sum_{k=1}^{\infty} e^{-2\lambda_n^k t} \left| a_n^k \right|^2 \le e^{-2\lambda_n^k t} \| u_0 - \overline{u}_n \|_{L^2_{\beta_n^{\star}}(\Omega)}^2.$$

Since $K_{T_n}^{\star} \stackrel{H}{\to} K_{T_{\infty}}^{\star}$ and $0 < \beta_1 \leq \beta_n^{\star}(x) \leq \beta_2$ a.e. $x \in \Omega$, the term $\|u_0 - \overline{u}_n\|_{L^2_{\beta_n^{\star}}(\Omega)}^2$ is uniformly bounded. Moreover, the uniform ellipticity of the sequence of tensors $K_{T_n}^{\star}$ lead to

$$\lambda_n^1 = \min_{\varphi \neq 0, \ \varphi \in H_0^1} \frac{\int_{\Omega} K_{T_n}^* \nabla \varphi \cdot \nabla \varphi}{\|\varphi\|_{L^2_{\beta_n^*}(\Omega)}^2} \ge \frac{k_1}{\beta_2} \min_{\varphi \neq 0, \ \varphi \in H_0^1} \frac{\int_{\Omega} \nabla \varphi \cdot \nabla \varphi}{\|\varphi\|_{L^2(\Omega)}^2} = \frac{k_1}{\beta_2} \lambda_1,$$

Convergence of $I_1^n \to 0$ as $T_n \to \infty$

Using the Fourier method,

$$\begin{aligned} v_n(t,x) &= \sum_{k=1}^{\infty} a_n^k e^{-\lambda_n^k t} \omega_n^k(x), \quad \omega_n^k \in H_0^1(\Omega), \quad \left\| \omega_n^k \right\|_{L^2_{\beta_n^\star}(\Omega)}^2 = \int_{\Omega} \beta_n^\star \left| \omega_n^k \right|^2 dx = 1 \\ & \left\{ \begin{array}{c} -\operatorname{div}\left(K_{T_n}^\star \nabla \omega_n^k \right) = \lambda_n^k \beta_n^\star \omega_n^k & \text{in } \Omega \\ \omega_n^k = 0 & \text{on } \partial\Omega, \end{array} \right. \end{aligned}$$

with $0<\lambda_n^1<\lambda_n^2\leq\lambda_n^3\leq\cdots$, its associated eigenvalues, and

$$a_{n}^{k}=\int_{\Omega}\beta_{n}^{\star}\left(x\right)\left(u_{0}\left(x\right)-\overline{u}_{n}\left(x\right)\right)\omega_{n}^{k}\left(x\right)dx,\quad k,n\in\mathbb{N}.$$

Using that $\beta_1 \leq \beta_n^{\star}(x)$ a.e. $x \in \Omega$ and Parseval's identity, we have

$$\beta_{1} \| v_{n}(t) \|_{L^{2}(\Omega)}^{2} \leq \| v_{n}(t) \|_{L^{2}_{\beta_{n}^{\star}}(\Omega)}^{2} = \sum_{k=1}^{\infty} e^{-2\lambda_{n}^{k}t} \left| a_{n}^{k} \right|^{2} \leq e^{-2\lambda_{n}^{1}t} \| u_{0} - \overline{u}_{n} \|_{L^{2}_{\beta_{n}^{\star}}(\Omega)}^{2}.$$

Since $K_{T_n}^{\star} \xrightarrow{H} K_{T_{\infty}}^{\star}$ and $0 < \beta_1 \leq \beta_n^{\star}(x) \leq \beta_2$ a.e. $x \in \Omega$, the term $\|u_0 - \overline{u}_n\|_{L^2_{\beta_n^{\star}}(\Omega)}^2$ is uniformly bounded. Moreover, the uniform ellipticity of the sequence of tensors $K_{T_n}^{\star}$ lead to

$$\lambda_{n}^{1} = \min_{\varphi \neq 0, \ \varphi \in H_{0}^{1}} \frac{\int_{\Omega} K_{T_{n}}^{\star} \nabla \varphi \cdot \nabla \varphi}{\left\|\varphi\right\|_{L^{2}_{\beta_{n}^{\star}}(\Omega)}^{2}} \geq \frac{k_{1}}{\beta_{2}} \min_{\varphi \neq 0, \ \varphi \in H_{0}^{1}} \frac{\int_{\Omega} \nabla \varphi \cdot \nabla \varphi}{\left\|\varphi\right\|_{L^{2}(\Omega)}^{2}} = \frac{k_{1}}{\beta_{2}} \lambda_{1},$$

Using the weak form of (8), and multiplying the heat equation in system (5) by $u_n(t, x)$ and integrating by parts,

$$I_{1}^{n} = \frac{1}{2} \frac{1}{T_{n}} \int_{\Omega} \beta_{n}^{\star} \left(u_{0}^{2}(x) - u_{n}^{2}(T_{n}, x) \right) dx + \frac{1}{T_{n}} \int_{0}^{T_{n}} \int_{\Omega} f(x) \left(u_{n}(t, x) - \overline{u}_{n}(x) \right) dx dt.$$

By (9) and the boundedness of $\|\overline{u}_n\|_{L^2(\Omega)}$, the first term in the right-hand side of this expression converges to zero as $T_n \to \infty$. Using once again (9) and the Cauchy-Schwartz inequality,

$$\begin{aligned} \frac{1}{T_n} \int_0^{T_n} \int_{\Omega} f(x) \left(u_n(t,x) - \overline{u}_n(x) \right) dx dt \\ &\leq \| \| \|_{L^2(\Omega)} \frac{1}{T_n} \int_0^{T_n} \| u_n(t) - \overline{u}_n \|_{L^2(\Omega)} dt \\ &\leq \| \| \|_{L^2(\Omega)} \frac{1}{T_n} \int_0^{T_n} C_1 e^{-C_2 t} dt \\ &\to 0 \quad \text{as } T_n \to \infty. \end{aligned}$$

э

Consequently, if (θ, K^*) is a minimizer of the function \overline{J}_T^* , it must satisfy $\delta \overline{J}_T^*(\theta, K^*) \ge 0$ for any admissible increments $\delta \theta, \delta K^*$.

Definition

Let $(\theta, K^*) \in \mathbf{RD}$ satisfy the optimality condition $\delta \overline{J}_T^*(\theta, K^*) \ge 0$. For any fixed T > 0, we introduce the symmetric matrix of order N

$$M_{T} = -\frac{1}{T} \int_{0}^{T} \nabla u \odot (2\nabla p + \nabla u) dt$$
(13)

where \odot denotes the symmetrized tensor product of two vectors, with entries

$$(M_{\mathcal{T}})_{ij} = -\frac{1}{2\mathcal{T}} \int_0^{\mathcal{T}} \left[(\nabla u)_i \left(2\nabla p + \nabla u \right)_j + (\nabla u)_j \left(2\nabla p + \nabla u \right)_j \right] dt, \quad 1 \le i, j \le N$$

where u and p are its associated state and adjoint state, respectively.

If $(f, u_0) \in (L^2(\Omega))^2$, then $u \in L^2(0, T; H^1_0(\Omega)) \cap C^0(0, T; L^2(\Omega))$ and then $p \in L^2(0, T; H^1_0(\Omega))$. This implies that $M_T \in L^1(\Omega)$.

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Definition

Let $(\theta, K^*) \in \mathbf{RD}$ satisfy the optimality condition $\delta \overline{J}_T^*(\theta, K^*) \ge 0$. For any fixed T > 0, we introduce the symmetric matrix of order N

$$M_{T} = -\frac{1}{T} \int_{0}^{T} \nabla u \odot (2\nabla p + \nabla u) dt$$
(13)

where \odot denotes the symmetrized tensor product of two vectors, with entries

$$(M_{\mathcal{T}})_{ij} = -\frac{1}{2\mathcal{T}} \int_0^{\mathcal{T}} \left[(\nabla u)_i \left(2\nabla \rho + \nabla u \right)_j + (\nabla u)_j \left(2\nabla \rho + \nabla u \right)_j \right] dt, \quad 1 \le i, j \le N$$

where u and p are its associated state and adjoint state, respectively.

Remark

If $(f, u_0) \in (L^2(\Omega))^2$, then $u \in L^2(0, T; H^1_0(\Omega)) \cap C^0(0, T; L^2(\Omega))$ and then $p \in L^2(0, T; H^1_0(\Omega))$. This implies that $M_T \in L^1(\Omega)$.

(17)

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ○ ○ ○

It is known that the optimal tensor K_T^{\star} of (17) must be simultaneously diagonalizable with M_T . Consequently, if $(e_j)_{1 \le j \le N}$ is a basis of eigenvectors of M_T with associated eigenvalues $(\mu_j)_{1 \le i \le N}$, then (17) transforms into

$$\mathcal{K}^{\star}_{T}: M_{T} = \max_{ig(\lambda_{j}ig)\in G_{ heta}}\sum_{j=1}^{N}\lambda_{j}\mu_{j}, \ \ (\lambda_{j})_{1\leq j\leq N}\in \sigma(\mathcal{K}^{0}), \mathcal{K}^{0}\in \mathcal{G}_{ heta}$$

$$\mathcal{K}_{T}^{\star}: M_{T} = \max_{(\lambda_{j}) \in G_{\theta}} \sum_{j=1}^{N} \lambda_{j} \mu_{j}, \quad (\lambda_{j})_{1 \le j \le N} \in \sigma(\mathcal{K}^{0}), \mathcal{K}^{0} \in G_{\theta}$$
(18)

Assume that $x \in \Omega$ is such that $M_T(x) \neq 0$. Since the cost function in (18) is linear and the set G_θ convex, the solution belongs to the boundary of G_θ . This implies that K_T^* corresponds to a sequential laminate of rank at most N with lamination directions given by the eigenvectors of M_T .

Assume that $x \in \Omega$ is such that $M_T(x) = 0$. one can not conclude directly from the relation (18) which degenerates. However, in that case and in dimension N = 2, the optimal tensor $K_T^* \in G_\theta$ may be replaced by a tensor which belongs to the boundary of G_θ without changing the value of the objective function. Indeed, assume that K_T^* belongs to the interior of G_θ

$$\frac{1}{\lambda_1 - k_1} + \frac{1}{\lambda_2 - k_1} < g^-(\theta) \equiv \frac{1}{\lambda^-(\theta) - k_1} + \frac{1}{\lambda^+(\theta) - k_1}$$

and that

$$\frac{1}{k_2 - \lambda_1} + \frac{1}{k_2 - \lambda_2} < g^+(\theta) \equiv \frac{1}{k_2 - \lambda^-(\theta)} + \frac{1}{k_2 - \lambda^+(\theta)}$$

Since the continuous function g^- is strictly increasing and satisfies $g^-(0) = 2/(k_2 - k_1) \le (\lambda_1 - k_1)^{-1} + (\lambda_2 - k_1)^{-1}$, there exists $\theta^- \in (0, \theta)$ such that

$$\frac{1}{\lambda_1 - k_1} + \frac{1}{\lambda_2 - k_1} = g^-(\theta^-).$$

$$\mathcal{K}_{T}^{\star}: M_{T} = \max_{(\lambda_{j}) \in G_{\theta}} \sum_{j=1}^{N} \lambda_{j} \mu_{j}, \quad (\lambda_{j})_{1 \le j \le N} \in \sigma(\mathcal{K}^{0}), \mathcal{K}^{0} \in G_{\theta}$$
(18)

Assume that $x \in \Omega$ is such that $M_T(x) \neq 0$. Since the cost function in (18) is linear and the set G_θ convex, the solution belongs to the boundary of G_θ . This implies that K_T^* corresponds to a sequential laminate of rank at most *N* with lamination directions given by the eigenvectors of M_T .

Assume that $x \in \Omega$ is such that $M_T(x) = 0$. one can not conclude directly from the relation (18) which degenerates. However, in that case and in dimension N = 2, the optimal tensor $K_T^* \in G_\theta$ may be replaced by a tensor which belongs to the boundary of G_θ without changing the value of the objective function. Indeed, assume that K_T^* belongs to the interior of G_θ

$$\frac{1}{\lambda_1 - k_1} + \frac{1}{\lambda_2 - k_1} < g^-(\theta) \equiv \frac{1}{\lambda^-(\theta) - k_1} + \frac{1}{\lambda^+(\theta) - k_1}$$

and that

$$\frac{1}{k_2 - \lambda_1} + \frac{1}{k_2 - \lambda_2} < g^+(\theta) \equiv \frac{1}{k_2 - \lambda^-(\theta)} + \frac{1}{k_2 - \lambda^+(\theta)}$$

Since the continuous function g^- is strictly increasing and satisfies $g^-(0) = 2/(k_2 - k_1) \le (\lambda_1 - k_1)^{-1} + (\lambda_2 - k_1)^{-1}$, there exists $\theta^- \in (0, \theta)$ such that

$$\frac{1}{\lambda_1 - k_1} + \frac{1}{\lambda_2 - k_1} = g^-(\theta^-).$$

$$\mathcal{K}_{T}^{\star}: M_{T} = \max_{(\lambda_{j}) \in \mathcal{G}_{\theta}} \sum_{j=1}^{N} \lambda_{j} \mu_{j}, \quad (\lambda_{j})_{1 \le j \le N} \in \sigma(\mathcal{K}^{0}), \mathcal{K}^{0} \in \mathcal{G}_{\theta}$$
(18)

Assume that $x \in \Omega$ is such that $M_T(x) \neq 0$. Since the cost function in (18) is linear and the set G_θ convex, the solution belongs to the boundary of G_θ . This implies that K_T^* corresponds to a sequential laminate of rank at most *N* with lamination directions given by the eigenvectors of M_T .

Assume that $x \in \Omega$ is such that $M_T(x) = 0$. one can not conclude directly from the relation (18) which degenerates. However, in that case and in dimension N = 2, the optimal tensor $K_T^* \in G_\theta$ may be replaced by a tensor which belongs to the boundary of G_θ without changing the value of the objective function. Indeed, assume that K_T^* belongs to the interior of G_θ

$$\frac{1}{\lambda_1 - k_1} + \frac{1}{\lambda_2 - k_1} < g^-(\theta) \equiv \frac{1}{\lambda^-(\theta) - k_1} + \frac{1}{\lambda^+(\theta) - k_1}$$

and that

$$\frac{1}{k_2-\lambda_1}+\frac{1}{k_2-\lambda_2} < g^+(\theta) \equiv \frac{1}{k_2-\lambda^-(\theta)}+\frac{1}{k_2-\lambda^+(\theta)}.$$

Since the continuous function g^- is strictly increasing and satisfies $g^-(0) = 2/(k_2 - k_1) \le (\lambda_1 - k_1)^{-1} + (\lambda_2 - k_1)^{-1}$, there exists $\theta^- \in (0, \theta)$ such that

$$\frac{1}{\lambda_1 - k_1} + \frac{1}{\lambda_2 - k_1} = g^-(\theta^-).$$

Similarly, since the continuous function g^+ is strictly decreasing and satisfies $g^+(1) = 2/(k_2 - k_1) \le (k_2 - \lambda_1)^{-1} + (k_2 - \lambda_2)^{-1}$, there exists $\theta^+ \in (\theta, 1)$ such that

$$\frac{1}{k_2-\lambda_1}+\frac{1}{k_2-\lambda_2}=g^+(\theta^+).$$

Consequently, at the point *x* where $M_T(x) = 0$, we may consider the composite with materials k_1 and k_2 in proportions θ^- and $(1 - \theta^-)$, respectively, or the composite with materials k_1 and k_2 in proportions $1 - \theta^+$ and θ^+ . Notice that this choice allows us to ensure that the volume constraint $||\theta||_{L^1(\Omega)} = L|\Omega|$ holds. In both cases, the

eigenvalues λ_1, λ_2 of K_T^* remain unchanged and so the value of the cost \overline{J}_T^* .

Now, we observe that the symmetric matrix $M_T^0(x)$, which is given by

$$M_{T}^{0}(x) = - \begin{pmatrix} \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{1}}\right)^{2} & \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{1}}\right) \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{2}}\right) \\ SYM & \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{2}}\right)^{2} \end{pmatrix}$$

is singular: $det(M_T^0(x)) = 0$ so that $arg(\max_{K^0 \in G_{\theta_T}} K^0 : M_T^0) = (\lambda_{\theta_T}^-, \lambda_{\theta_T}^+)$

For any $T \ge \sup_{x \in \Omega} T^+(x)$, the solution of the problem $\max_{K^0 \in G_{\theta_T}} K^0 : M_T$ is $(\lambda^-_{\theta_T}, \lambda^+_{\theta_T})$ so that the optimal tensor K^*_T is a first order laminate.

$$c_{mn}^{T} = -\frac{f_m^{T}}{\lambda_m^{T}}\frac{f_n^{T}}{\lambda_n^{T}} + \frac{1}{T}\frac{f_n^{T}}{(\lambda_m^{T})^2(\lambda_n^{T})^2}(\lambda_n^{T}f_m^{T} - \lambda_m^{T}a_m^{T}\lambda_n^{T}) + O(e^{-\lambda_m^{T}}, e^{-\lambda_n^{T}T})$$

where the coefficients $c_{mn}^{i,T}$ are bounded with respect to T. Notice that only the coefficients of the heat source *f* are involved in the first order terms $c_{mn}^{0,T}$. We put

$$M_T(x) = M_T^0(x) + rac{M_T^1(x)}{T} + M^2(T,x), \quad x \in \Omega.$$

Now, we observe that the symmetric matrix $M_T^0(x)$, which is given by

$$M_{T}^{0}(x) = - \begin{pmatrix} \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{1}}\right)^{2} & \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{1}}\right) \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{2}}\right) \\ SYM & \left(\sum_{m>0} \frac{f_{m}^{T}}{\lambda_{m}^{T}}(w_{m}^{T})_{x_{2}}\right)^{2} \end{pmatrix}$$

is singular: $det(M^0_T(x)) = 0$ so that $arg(\max_{K^0 \in G_{\theta_T}} K^0 : M^0_T) = (\lambda^-_{\theta_T}, \lambda^+_{\theta_T})$

Proposition (T large)

For any $T \ge \sup_{x \in \Omega} T^+(x)$, the solution of the problem $\max_{K^0 \in G_{\theta_T}} K^0 : M_T$ is $(\lambda_{\theta_T}^-, \lambda_{\theta_T}^+)$ so that the optimal tensor K_T^* is a first order laminate.

The analysis for T arbitrarily small is similar. Precisely, we obtain

$$c_{mn}^{T} = a_{m}^{T}a_{n}^{T} - \frac{1}{2}a_{m}^{T}a_{n}^{T}(\lambda_{m}^{T} + 3\lambda_{n}^{T})T + \frac{1}{2}(a_{m}^{T}f_{m}^{T} + a_{n}^{T}f_{m}^{T})T + O(T^{2}), \quad m, n > 0$$
(21)

so that we decompose the matrix M_T as $M_T(x) = M_T^0(x) + TM_T^1(x) + M_T^2(T, x)$ in Ω , where the symmetric matrix M_T^0 depends only on the coefficients a_T^m of the initial condition u_0 , assumed different from zero. By arguing as before, we obtain that $M_T^0(x)$ is singular so that for T small enough, says $T \leq T^-(x)$, the determinant of $M_T(x)$ is negatif.

Proposition (T small)

For any $T \leq \inf_{x \in \Omega} T^-(x)$, the solution of the problem $\max_{K^0 \in G_{\theta_T}} K^0 : M_T$ is $(\lambda_{\theta_T}^-, \lambda_{\theta_T}^+)$ so that the micro-structure is recovered by first order laminates.

If
$$u_0 = 0$$
, $M_T^0 = M_T^1 = 0$ and $M_T(x) = T^2 M_T^2 + ...$ with $det(M_T^2(x)) \le 0$ for all $x \in \Omega$
 $T > 0$.
